Dentures That Look So Real No One Will Know They're Not.

Most professionals agree that the upper anterior teeth determine the aesthetics of a smile. Consideration is given to the upper anterior arch width of the upper anterior teeth relative to key facial features, the length of the centrals, laterals, and canines, and the amount of tooth structure showing. Together, these factors determine the quality of one's smile.

Geneva 2000®
Smile Design Denture

For approximately 40 million Americans, daily denture wear is a fact of life. Ordinary dentures leave little room for customization. Men and women, old and young, receive essentially the same look. The result is a uniform row of identical teeth, causing many dentures to look "false." But for those who have discovered the advantages of a custom-made Geneva 2000® Smile Design Denture, there's plenty to smile about.

Clinical studies show that 80% of all denture patients want more than what standard dentures have to offer. This same clinical research indicates that when introduced to Geneva 2000® Smile Design Dentures, eight out of ten patients chose Geneva 2000®.

Premium Quality Premium Aesthetics

More patients choose Geneva 2000® Smile Design Dentures because of their superior beauty and natural life-like appearance. Each Geneva 2000® Porcelain Denture tooth is hand-finished creating natural differences in shapes of individual teeth. Adding to the natural aesthetic qualities is a special technique of layering different colors of porcelain. The transparency, translucence and refractive quality of the layered porcelain combined with the hand-finish result in a superior quality unmatched by any denture on the market. Other advantages of porcelain include:

- Abrasion-resistant quality.
- Resistance to oral conditions to prevent plaque and bacterial buildup.
- Color stability

Not All Dentures Are Created Equally!

Geneva 2000® Anterior Teeth are only the beginning; the complete system makes the difference.

A Geneva Smile Design provider combines **four key components**, which when used together, deliver consistent life-like and natural results:

- 1. Geneva 2000® Denture Teeth** -- Geneva 2000® porcelain anterior teeth achieve the best results. When porcelain is not an option, use Geneva 2000® teeth made from the highest quality synthetic materials. These teeth are imported from Switzerland and are individually sculpted in masculine and feminine mold designs.
- 2. The Geneva Esthetic Tools** -- the Alimeter and Papillameter are used to create personalized aesthetic guidelines for the denture.
- 3. Vertical Centric Recorder Device** -- an intra-oral device used to obtain the correct vertical dimension and centric relation for the denture to enhance function and facial aesthetics.
- 4. A new clinically proven treatment approach** -- When working with an experienced Geneva 2000® lab technician, your dental professional can create a full natural, and customized smile that improves your overall facial aesthetics. The process begins with a series of detailed measurements that take into account a patient's individual mouth and facial dimensions. Patients may choose from a wide range of custom Smile Designs to ensure a customized set for each individual patient.

Where porcelain is not an option, such as when denture teeth oppose natural teeth, Geneva Dental can provide a wide range of premium quality, natural looking denture teeth made from the highest quality synthetic materials available.
